WHAT IS CLAIMED IS:

1. An intermediate layer material composition for a multilayer resist process, comprising (A) a polymer containing a repeating unit having on a side chain thereof a group represented by the following general formula (A-I):

wherein R_1 represents an alkyl group, an alkoxyl group, an aryl group, an aralkyl group, a cyclopentyl group or a cyclohexyl group; a plurality of R_1 's each may be the same or different.

2. The intermediate layer material composition described in claim 1, wherein the polymer is a polymer having at least one of repeating units represented by the following general formulas (a-1) to (a-4):

wherein (A-I) represents the group represented by the general formula (A-I) described in claim 1; R_2 represents a hydrogen atom or a methyl group; R_3 represents an alkylene group or a phenylene group; R_4 represents an alkylene group, a phenylene group or $-C(=O)-O-R'-$; R' represents an alkylene group.

3. The intermediate layer material composition described in claim 1, wherein the polymer further contains at least one of a repeating unit represented by the following general formula (A-II) and a repeating unit represented by the following general formula (A-III):

wherein R_5 represents a hydrogen atom or a methyl group; R_6 represents an aryl group or an aralkyl group.

4. The intermediate layer material composition

'described in claim 1, wherein the polymer contains the repeating unit having on a side chain thereof the group represented by the following general formula (A-I) in an amount of 3 to 90 mol%.

5. The intermediate layer material composition described in claim 1, which further comprises (B) a crosslinking agent.

6. The intermediate layer material composition described in claim 5, wherein the crosslinking agent (B) is a phenol derivative having a molecular weight of 1,200 or less, containing 3 to 5 benzene rings in its molecule, and having 2 or more hydroxymethyl groups or alkoxymethyl groups in total, wherein the hydroxymethyl groups or alkoxymethyl groups bind to the benzene rings.

7. The intermediate layer material composition described in claim 1, which further comprises (C) a compound capable of generating an acid by heat.

8. The intermediate layer material composition described in claim 1, which further comprises (D) a solvent.

9. The intermediate layer material composition

described in claim 1, which further comprises (E) a surfactant.

10. A process for forming a resist pattern, which comprises:

forming on a substrate a lower resist layer comprising an organic material;

forming on the lower resist layer an intermediate layer using the intermediate layer material composition described in claim 1;

forming on the intermediate layer an upper resist layer comprising an organic material crosslinkable or decomposable by a radiation exposure;

forming a predetermined pattern on the upper resist layer; and

etching the intermediate layer, the lower resist layer and the substrate, sequentially.

11. The process described in claim 10, wherein the intermediate layer is formed by coating the intermediate layer material composition described in claim 1 on the lower resist layer, and then baking the coating to be insolubilized in an organic solvent.

12. The process described in claim 11, wherein the coating is baked at a temperature of 150 to 250°C.

13. The process described in claim 10, wherein the lower resist layer has a thickness of 0.1 to 4.0 μm .

14. The process described in claim 10, wherein the intermediate layer has a thickness of 0.02 to 0.6 μm .

15. The process described in claim 10, wherein the upper layer has a thickness of 0.03 to 0.6 μm .

L11 ANSWER 1 OF 18 HCA COPYRIGHT 2004 ACS on STN

140:365500 Fluoropolymer **resists** for 157 nm lithography.

Vohra, Vaishali R.; Liu, Xiang-Qian; Douki, Katsuji; Ober, Christopher K.; Conley, Will; Zimmerman, Paul; Miller, Daniel (Department of Materials Science & Engineering, Cornell Univ., Ithaca, NY, 14853, USA). Proceedings of SPIE-The International Society for Optical Engineering, 5039(Pt. 1, Advances in Resist Technology and Processing XX), 539-547 (English) 2003. CODEN: PSISDG. ISSN: 0277-786X. Publisher: SPIE-The International Society for Optical Engineering.

AB Fluoropolymers have been shown to be one of the best materials for high transparency of 157 nm wavelength radiation. Both **resists** and pellicles are being designed from such materials. One of the authors approaches to improved transparency for 157 nm **resists** is based upon fluorinated variations of polymethacrylate and polyhydroxystyrene derivs. Lithog. studies were carried out on exptl. **resist** platforms using 157 and 248 nm steppers, and it was shown that, after selective modification, it is possible to use conventional **resist** backbones, such as acrylic or styrenic, in the design of single-layer **resists** for 157 nm lithog. It has been demonstrated in the authors studies that 157 nm absorbance of these materials can be as low as 1.5-2.0 μm^{-1} . Another approach to 157 nm **resist** design is based upon fluorinated backbone variations. Research will be described focusing on several new monomers having fluorine functions such as -F and -CF₃ groups near a polymerizable double bond to improve transparency at 157 nm and to raise the **resist** glass transition temp. compared to their

hydrocarbon analogs. Due to the lower electron d. of the double bond, these monomers can be copolymd. with electron-rich vinyl monomers. As an extension to this strategy, the authors are synthesizing novel fluoropolymers having partially fluorinated monocyclic structures with radical cyclo-polymn. These polymers have the C-F bond on the polymer main chain and also possess acid labile groups as part of a ring structure to eliminate degassing. In order to further enhance the transparency of these systolic polymers at 157 nm, we have eliminated the carbonyl group. The cyclic nature of the polymer will result in a high glass transition temp.

L11 ANSWER 3 OF 18 HCA COPYRIGHT 2004 ACS on STN

140:261284 The challenges of 157 nm nanolithography: surface morphology of silicon-based copolymers. Sarantopoulou, E.; Kollia, Z.;

Kocevar, K.; Musevic, I.; Kobe, S.; Drazic, G.; Gogolides, E.; Argitis, P.; Cefalas, A. C. (Theoretical and Phys. Chem. Inst., National Hellenic Research Foundation, Athens, 11635, Greece). Materials Science & Engineering, C: Biomimetic and Supramolecular Systems, C23(6-8), 995-999 (English) 2003. CODEN: MSCEEE. ISSN: 0928-4931. Publisher: Elsevier Science B.V..

AB Lithog. at 157 nm using F2 laser is the next step after 193 nm for ULSI fabrication with dimensions below 50 nm. However, there are problems related to the development of the 157 nm technol., the most important being the design of **photoresists** with suitable absorption at 157 nm and low outgassing. On the other hand, high-resoln. capabilities of **resist** depend on the surface roughness and its modification following 157 nm illumination of the **resist**. In this communication, a copolymer of ethyl-polyhedral oligomeric silsesquioxane (ethyl-POSS) and tert-Bu methacrylate (TBMA) was evaluated for surface homogeneity, before and after exposure to 157 nm at different concns. of the homopolymers. Surface roughness depends on the chem. compn. of the **resist**, and at. force microscope (AFM) images of exposed areas indicate accumulation of matter at the edge of the boundaries between exposed and non-exposed areas.

140:261279 Polyhedral oligomeric silsesquioxane (POSS) based **resist** materials for 157-nm lithography. Tegou, Evangelia; Bellas, Vassilios; Gogolides, Evangelos; Argitis, Panagiotis; Dean,

Kim R.; Eon, David; Cartry, Gilles; Cardinaud, Christophe (Institute of Microelectronics, Aghia Paraskevi, 15310, Greece). Proceedings of SPIE-The International Society for Optical Engineering, 5039(Pt. 1, Advances in Resist Technology and Processing XX), 453-461 (English) 2003. CODEN: PSISDG. ISSN: 0277-786X. Publisher: SPIE-The International Society for Optical Engineering.

AB Novel polymers contg. polyhedral oligomeric silsesquioxane (POSS) pendant groups have been synthesized and evaluated as components of 157 nm **resist** formulations. Random copolymers of polymerizable, ethyl-POSS contg. monomers with various acrylates, including tert-Bu methacrylates, were first used in pos., aq. base-developable **resist** formulations and evaluated at thicknesses in the range of 100 nm. Copolymers with optimized monomer compn. do not present strong self-organization phenomena and provide materials with good film forming properties, and high sensitivity at 157 nm (1-10 mJ/cm² under open field exposure). Process studies reveal strong influence of thermal processing conditions and development concns. on swelling of unexposed and underexposed **resist** areas. Similar results are obtained from Dissoln. Rate Monitoring (DRM) studies. A typical process selected for selling redn. includes pre-exposure and post-exposure bakes at 160° C (2 min) and selection of low strength developers. High resoln. patterning under these conditions has shown potential for sub 130 nm lithog. upon further material optimization. On the other hand, pattern transfer studies have shown that 100 nm thick films of POSS contg. materials, having the same silicon content as the ones evaluated for high resoln. 157 nm lithog., provide the necessary oxygen plasma resistance for use as bilayer **resists**. XPS was used for surface characterization before plasma etching. Both XPS and angular XPS characterization have revealed that the POSS moieties tend to segregate preferentially on the free surface of the films.

combination of both enhanced etch resistance and enhanced
sensitivity required to satisfy both low and high voltage patterning
applications. **Resist** sensitivity was enhanced by the
direct incorporation of a photoacid generating monomer into the
resist polymer backbone while the etch resistance of the
material was improved by copolymn. with polyhedral oligo
silsesquioxane methacrylate monomer.

AB Title lithog. materials, suitable for optical lithog. in the UV region (including 157 nm and extreme UV region), and for electron beam lithog., are based on polymers characterized by having polyhedral oligomeric silsesquioxanes in their mol. Et, or similar or smaller size, groups are used as alkyl substituents of the silsesquioxanes in order to reduce problems related to pattern transfer, roughness, and high absorbance at 157 nm (such problems occur when the substituents are large alkyl groups such as cyclopentyl groups).

139:188229 High sensitivity nanocomposite **resists** for EUV lithography. Azam Ali, M.; Gonsalves, K. E.; Golovkina, V.; Cerrina, F. (Department of Chemistry and Cameron Applied Research Center, Polymer Chemistry NanoTechnology Lab., The University of North Carolina, Charlotte, NC, 28223, USA). Microelectronic Engineering, 65(4), 454-462 (English) 2003. CODEN: MIENEF. ISSN: 0167-9317. Publisher: Elsevier Science B.V..

AB A novel nanocomposite **photoresist** was synthesized for

extreme UV lithog. (EUVL) by a radical polymn. process. This **resist** system exhibited enhanced sensitivity and contrast for EUVL. The potential for EUVL nanofeatures is also examd. The high sensitivity and the desirable contrast in this **resist**, indicates that it is a promising candidate not only for sub-100 nm resoln. EUVL, but also for X-ray lithog. and low voltage electron beam lithog.

138:311424 Evaluation of siloxane and polyhedral silsesquioxane copolymers for 157 nm lithography. Bellas, V.; Tegou, E.; Raptis, I.; Gogolides, E.; Argitis, P.; Iatrou, H.; Hadjichristidis, N.; Sarantopoulou, E.; Cefalas, A. C. (Institute of Microelectronics, NCSR Demokritos, Aghia Paraskevi, 15310, Greece). Journal of Vacuum

Science & Technology, B: Microelectronics and Nanometer Structures, 20(6), 2902-2908 (English) 2002. CODEN: JVTBD9. ISSN: 0734-211X. Publisher: American Institute of Physics.

AB Siloxane and silsesquioxane copolymers have been synthesized and first evaluated as potential components of 157 nm **resist** materials. In block copolymers of dimethylsiloxane and tert-Bu methacrylate neg. imaging chem. dominates at 157 nm, due to the presence of the siloxane component, although pos. imaging in aq. base developers via chem. amplification was obtained at longer wavelengths (248 nm). The same behavior is obsd. in graft copolymers of dimethylsiloxane and tert-Bu methacrylate. On the other hand, random copolymers of polymerizable polyhedral oligomeric silsesquioxane monomers with various acrylates, including partially fluorinated, can be used as components of **resist** formulations that provide pos. imaging at 157 nm, aq. base development, and physicochem. properties which resemble those of conventional poly(meth)acrylates. Pattern transfer properties depend on the selection of the silsesquioxane component. Polymers contg. 30% or higher wt./wt. ethyl-substituted silsesquioxane cages provide the necessary etch resistance as well as low surface roughness to oxygen plasma at 100 nm film thickness, allowing bilayer 157 nm lithog., even without further absorbance optimization.

137:287293 Heat-resistant silsesquioxane-based polymers and their films and manufacture method. Kobayashi, Toshiaki; Hayashi, Teruyuki; Tanaka, Masato; Yamaguchi, Koichi (Ministry of Economy, Trade and Industry; National Industrial Research Institute, Japan; National Institute of Advanced Industrial Science and Technology). Jpn. Kokai Tokkyo Koho JP 2002284878 A2 20021003, 8 pp. (Japanese). CODEN: JKXXAF. APPLICATION: JP 2001-91233 20010327.

AB The polymers are prep'd. by reacting hydridosilsesquioxanes $(\text{HSiO}_{3/2})_n$ ($n = 4-1000$) with $\text{RC.tplbond.C(R')qC.tplbond.CR}$ [$R =$ (un)substituted org. group, organosilyl group; $R' =$ (un)substituted divalent org. group, organometallic group; $q = 0, 1$] or (un)substituted monoacetylenes. The films obtained from the polymers have good adhesion with substrates, and are useful for prodn. of crack-free dielec. films, semiconductor passivation films, **resists**, and interlayer insulating films. Thus, a copolymer of 1,3-bis(phenylethynyl)benzene and pentacyclo[9.5.1.13,9.15,15.17,13]octasiloxane was dissolved in THF, spin-coated on glass, and heated at 110° for 10 min to give a smooth film showing no cracks.

AB The present invention provides new high resoln. **resists** applicable to next generation lithogs., methods of making these novel **resists**, and methods of using these new **resists** in lithog. processes to effect state-of-the-art lithogs. New nanocomposite **resists** comprising polymers of the general formula I (R = alkyl, cycloalkyl, silyl, aryl, aralkyl, alkenyl) and nanoparticles in a polymer matrix are provided in the invention. New chem. amplified **resists** that incorporate inorg. moieties as part of the polymer and chem. amplified **resists** that incorporate photoacid generating groups within the polymeric chain are presented. Novel non-chem. amplified yet photosensitive **resists**, and new org.-inorg. hybrid **resists** are also provided. This invention and the

embodiments described constitute fundamentally new architectures for high resoln. **resists** that achieve high sensitivity, contrast, resoln. and high plasma etch resistance.

- AB Except for ion-beam lithog., deep-UV (DUV), x-ray, and in particular
electron-beam lithog. suffer significantly from proximity effects,
leading to severe degrdn. of resoln. in classical **resists**.
The authors report a new class of **resists** based on
org./inorg. nanocomposites having a structure that reduces the
proximity effects. Synthetic routes are described for a
ZEP520/nano-SiO2 **resist** where 47 nm wide lines have been
written with a 40 nm diam., 20 keV electron beam at no sensitivity
cost. Other **resist** systems based on polyhedral
oligosilsesquioxane copolymd. with Me methacrylate, tert-Bu
methacrylate, methacrylic acid and a proprietary photoacid generator
are also presented. These nanocomposite **resists** suitable
for DUV and electron beam lithog. show enhancement in both contrast
and RIE resistance in oxygen. Tentative mechanisms responsible for
proximity effect redn. are also discussed.

 Institute of Physics.

AB A chem. amplified (CA) methacrylate **resist** contg. polyhedral oligosilsesquioxane (POSS) has been synthesized by AIBN-initiated free radical polymn. While the polymer of low POSS concns. showed little improvement in reactive ion etching (RIE) resistance, incorporation of 20.5 wt.% of the POSS monomer into methacrylate-based CA **resists** significantly improved their RIE resistance in the O₂ plasma. High-resoln. transmission electron microscopy revealed that the RIE resistance improvement was due to the formation of rectangular crystallite-constituting networks of the silica cages uniformly distributed within the polymer matrix.

- AB A sulfonium photoacid generating monomer was synthesized using a four-step synthesis scheme. This PAG monomer was successfully incorporated into methacrylate based chem. amplified **resists** by free radical copolymn. The **resists** were found to exhibit excellent film formation behavior due to absence of phase sepn., and extremely high sensitivity owing to high PAG loading in the polymer chain. Lithog. properties of the **resists** were also evaluated under both 248 nm and 20 keV electron radiation.

High sensitivity also affords these **resists** as potential candidates for low voltage EB lithog.

- AB Polyhedral oligo-silsesquioxane methacrylate (POSSMA)/methyl methacrylate (MMA)/tert-Bu methacrylate (TBMA)/CMe3 acrylate (TBA) copolymers were synthesized by soln. polymn. Their preliminary lithog.-related properties were studied. The mass ratio of MMA/POSSMA, 85.8/14.2, leads to an x-ray **resist** with a high contrast of 23.5 without sacrificing the sensitivity (1350 mJ/cm²) which remains comparable to that of std. PMMA. By careful manipulation of components and compns., this generic type of polymer could potentially be used as a DUV or e-beam **resist** as well.

(English) 1997. CODEN: MIENEF. ISSN: 0167-9317. Publisher:
Elsevier.
- AB Fabrication techniques in microelectronics as well as in micro
mechanics, micro optics and micro fluidics favor the application of
a dry **resist** process due to environmental protection and
reproducibility in the processing. The applicability of the dry,
neg. tone **resist** using octavinylsilsesquioxane as a
monomer unit is investigated by three different lithogs. Deep
UV-lithog. with excimer laser radiation, electron-beam, and x-ray
lithog. with synchrotron radiation is employed to measure the
characteristics of this **resist**. For deep UV-lithog., the
resist shows ablation which means a pos. action as well as
polymn. for neg. action depending on the wavelength and the fluence
range applied. Under electron beam and X-ray exposure the material
acts as a neg. tone **resist** with high sensitivity and
spatial resolu. The characteristic curves of the **resist**
using the three lithogs. are presented.

138:14196 Glass transition temperatures of poly(hydroxystyrene-co-vinylpyrrolidone-co-isobutylstyryl polyhedral oligosilsesquioxanes). Xu, Hongyao; Kuo, Shiao-Wei; Lee, Juh-Shyong; Chang, Feng-Chih (Institute of Applied Chemistry, National Chiao-Tung University, Hsin-Chu, 30043, Taiwan). Polymer, 43(19), 5117-5124 (English) 2002. CODEN: POLMAG. ISSN: 0032-3861. Publisher: Elsevier Science Ltd..

AB A series of poly(hydroxystyrene-co-vinylpyrrolidone-co-isobutylstyryl polyhedral oligosilsesquioxanes) (PHS-PVP-POSS) hybrid polymers with various POSS contents was prepd. by free radical copolymn. of acetoxystyrene, vinylpyrrolidone with styrylisobutyl polyhedral oligosilsesquioxanes (POSS), followed by selective removal of the acetyl protective group. The POSS content of a hybrid polymer can be effectively controlled by varying the

feed ratios of reactants. The Tg of the POSS hybrid increases with the POSS content of PHS-PVP-POSS hybrids. The mechanism of Tg enhancement in these PHS-PVP-POSS hybrids was investigated using DSC, FTIR and GPC. The formation of the phys. cross-linked POSS in these hybrid polymers trends to restrict polymer chain motion and results in significant Tg increase.

137:385162 Preparations, Thermal Properties, and Tg Increase Mechanism of Inorganic/Organic Hybrid Polymers Based on Polyhedral Oligomeric Silsesquioxanes. Xu, Hongyao; Kuo, Shiao-Wei; Lee, Juh-Shyong; Chang, Feng-Chih (Department of Applied Chemistry, National Chiao-Tung University, Hsin Chu, Taiwan). *Macromolecules*, 35(23), 8788-8793 (English) 2002. CODEN: MAMOBX. ISSN: 0024-9297. Publisher: American Chemical Society.

AB A series of novel hybrid poly(acetoxystyrene-co-isobutylstyryl-POSS)s (PAS-POSS) and poly(vinylpyrrolidone-co-isobutylstyryl-POSS)s (PVP-POSS) was synthesized and characterized. The POSS content in these hybrids can be controlled by varying the monomer feed ratio. The polyhedral oligosilsesquioxane (POSS) moiety can effectively increase the Tg of the resultant org./inorg. hybrid polymer at a relatively high POSS content and produce the hybrid copolymer with narrower mol. wt. distribution. The FTIR spectra are used to investigate the structure-property relationship of these hybrid polymers, and the Tg enhancement mechanism is discussed in detail.

136:248253 Polymer hybrids of functionalized silsesquioxanes and organic polymers utilizing the sol-gel reaction of tetramethoxysilane. Kim, Kyung-Min; Adachi, Kaoru; Chujo, Yoshiki (Graduate School of Engineering, Department of Polymer Chemistry, Kyoto University, Yoshida, Sakyo-ku, Kyoto, 606-8501, Japan). Polymer, Volume Date 2002, 43(4), 1171-1175 (English) 2001. CODEN: POLMAG. ISSN: 0032-3861. Publisher: Elsevier Science Ltd..

AB The ternary polymer hybrids were prepd. by org. polymers such as poly(2-methyl-2-oxazoline) (POZO) or poly(N-vinylpyrrolidone) (PVP) and aminopropylsilsesquioxane (Cube-aminopropyl) utilizing the sol-gel reaction of tetramethoxysilane (TMOS). The prepd. polymer hybrids were characterized by IR, thermogravimetric anal. (TGA), X-ray diffraction (XRD), ¹H NMR, SEM, etc. In this hybrid system, hydrogen-bonding interactions played a crit. role in the formation of the transparent polymer hybrids. Polymer hybrids using POZO showed high transparency and homogeneity in a wide range of the feed ratios of POZO to Cube-aminopropyl. On the other hand, in case of polymer hybrids using PVP, higher Cube-aminopropyl ratio brought about the phase sepn., indicating the aggregation of the Cube-aminopropyl itself. The homogeneity of ternary polymer hybrids was found to be closely dependent on the difference between strength of hydrogen bonding interaction of polymer and residual silanol groups of silica gel and strength of that of polymer and Cube-aminopropyl. It is also obsd. that initial decompn. temp. of polymer hybrids was increased with increasing the Cube-aminopropyl ratio.

137:338540 Nanostructured Polyethylene-POSS Copolymers: Control of Crystallization and Aggregation. Waddon, A. J.; Zheng, L.; Farris, R. J.; Coughlin, E. Bryan (Department of Polymer Science and Engineering, University of Massachusetts, Amherst, MA, 01003, USA). Nano Letters, 2(10), 1149-1155 (English) 2002. CODEN: NALEFD. ISSN: 1530-6984. Publisher: American Chemical Society.

AB Nanoscale structure formation in copolymers of polyethylene (PE) and polyhedral oligomeric silsesquioxane (POSS) with norbornene and cyclopentyl side-groups can be controlled through choice of crystn. conditions. Aggregates of both cryst. PE and cryst. POSS are found when crystd. from the melt. A self-assembled, two-phase cryst. structure, consisting of POSS cryst. domains molecularly connected to PE cryst. domains, is formed. Constraints on domain growth arise from mol. architecture, likely leading to anisotropy in the shape of POSS domains. Considerable suppression of POSS crystn. is found on pptn. from soln. The origin of the frustration of crystal growth and the introduction of disorder is discussed. Structural investigative methods include X-ray diffraction and transmission electron microscopy. Degrtn. temps. are found to be dependent on the morphol. of the nanocomposites, with possible implications for improved thermal resistance.

AB A gas separator, a method for producing the gas separator, and a method for sepg. gases based on a property of inelasticity of the gases. The inventive gas separator is a permeable porous material for sepg. a mixt. of gases by selectable pore size exclusion, comprising pores formed with at least one nanostructured compd. In other words, the inventive porous material can be used to sep. a mixt. of gases based upon the different working diam. of each of the gases. By selecting specific nanostructured compds., the porous material can be tailored to contain pores of a predetd. size which allow gases having a working diam. smaller than the size of the pores to pass through the material while preventing the passage of gases having a working diam. greater than the size of the pores.

132:348081 Strain recovery in POSS hybrid thermoplastics. Mather, Patrick T.; Jeon, Hong G.; Haddad, T. S. (Polymer Program, Institute of Materials Science, University of Connecticut, Storrs, CT, 06269-3136, USA). Polymer Preprints (American Chemical Society, Division of Polymer Chemistry), 41(1), 528-529 (English) 2000. CODEN: ACPPAY. ISSN: 0032-3934. Publisher: American Chemical Society, Division of Polymer Chemistry.

AB Polyhedral oligomeric silsesquioxane (POSS) macromer consist of a well-defined cluster inorg. silica-like core surrounded by org. corner groups only one being reactive for polymn. The goal is to develop compn.-microstructure and microstructure-property relationships for POSS materials with particular focus on mech. relaxation behavior. As such, we will report the microstructure and mech. properties of the polynorbornene-POSS copolymer system in which we have systematically varied the nonreactive corner group, R, and the mole fraction of POSS present in random copolymers. In particular, we will discuss interesting "shape-memory" behavior obsd. for drawn specimens and detail the impact of POSS incorporation on such characteristics as strain recovery, recovery rate, and retraction stability. The origin of shape-memory alteration with POSS incorporation is discussed with respect to nanostructures formed as revealed by transmission electron microscopy.

139:365783 Castable shape memory polymers. Mather, Patrick T.; Liu, Changdeng (University of Connecticut, USA). PCT Int. Appl. WO 2003093341 A1 20031113, 26 pp. DESIGNATED STATES: W: AE, AG, AL, AM, AT, AU, AZ, BA, BB, BG, BR, BY, BZ, CA, CH, CN, CO, CR, CU, CZ, DE, DK, DM, DZ, EC, EE, ES, FI, GB, GD, GE, GH, GM, HR, HU, ID, IL, IN, IS, JP, KE, KG, KP, KR, KZ, LC, LK, LR, LS, LT, LU, LV, MA, MD, MG, MK, MN, MW, MX, MZ, NO, NZ, OM, PH, PL, PT, RO, RU, SC, SD, SE, SG, SK, SL, TJ, TM, TN, TR, TT, TZ, UA, UG, US, UZ, VC, VN, YU, ZA, ZM, ZW, AM, AZ, BY, KG, KZ, MD, RU, TJ, TM; RW: AT, BE, BF, BJ, CF, CG, CH, CI, CM, CY, DE, DK, ES, FI, FR, GA, GB, GR, IE, IT, LU, MC, ML, MR, NE, NL, PT, SE, SN, TD, TG, TR. (English). CODEN: PIXXD2. APPLICATION: WO 2003-US13355 20030430. PRIORITY: US 2002-PV377544 20020502.

AB Shape memory polymers prepd. by copolyng. two monomers, which each sep. produce polymers characterized by different glass transition temps. in the presence of a difunctional monomer whereby the copolymer formed is cross-linked during the polymn. to form a thermoset network. The transition temp. of the final polymers is adjusted by the ratio of the monomers selected, to 20-110°, while the degree of crosslinking controls the rubbery modulus plateau. The shape memory polymers can be processed as castable formulations in the form of coatings and films. The copolymers are optically transparent and are useful as medical plastics. The invention also relates to the articles of manuf. thereof and methods of the prepn. and use thereof.

L28 ANSWER 8 OF 23 HCA COPYRIGHT 2004 ACS on STN

138:107082 Synthesis and properties of novel fluoroalkyl end-capped oligomers containing silsesquioxane segments. Sawada, Hideo; Yoshioka, Hiroaki; Ohashi, Ryusei; Kawase, Tokuzo (Department of Chemistry, Nara National College of Technology, Nara, 639-1080, Japan). Journal of Applied Polymer Science, 86(14), 3486-3493 (English) 2002. CODEN: JAPNAB. ISSN: 0021-8995. Publisher: John Wiley & Sons, Inc..

AB Fluoroalkyl end-capped homo- and cooligomers contg. silsesquioxane segments were prepd. by the reactions of fluoroalkanoyl peroxides with the corresponding methacrylate monomer-bearing silsesquioxane unit (Si-MMA) and comonomers such as N,N-dimethylacrylamide (DMAA) and acrylic acid (ACA). These new fluorinated Si-MMA oligomers were easily sol. in various org. solvents and were able to reduce the surface tension of m-xylene effectively. The modified poly(Me

methacrylate) [PMMA] and glass surface treated with fluorinated Si-MMA homo-oligomers exhibited a strong oleophobicity, although these fluorinated oligomers possess high oleophilic silsesquioxane segments. In contrast, the modified PMMA surface treated with fluorinated Si-MMA-DMAA cooligomers exhibited a good hydrophilicity with a strong oleophobicity. In a series of fluorinated Si-MMA oligomers, fluorinated Si-MMA homo-oligomers had a relatively high thermal stability. Therefore, these fluoroalkyl end-capped Si-MMA oligomers are suggested to have high potential for new functional materials through their unique properties such as a high soly. and surface active properties.

137:20623 Copolymers of MMA and polyhedral oligosilsesquioxanes (POSS) with thermal property enhancements. Xiao, Jun; Feher, Frank J. (Dep. Chem., Univ. California, Irvine, CA, 92697-2025, USA). Polymer Preprints (American Chemical Society, Division of Polymer

Chemistry), 43(1), 504-505 (English) 2002. CODEN: ACPPAY. ISSN: 0032-3934. Publisher: American Chemical Society, Division of Polymer Chemistry.

AB Copolymers of Me methacrylate and polyhedral oligosilsesquioxanes POSS were synthesized and the reactivity ratios of the two comonomers were calcd. POSS showed high reactivity when it copolymd. with Me methacrylate. Thermal property measurements indicate that incorporation of POSS into PMMA can increase the glass transition temp. and thermal decompn. temp. dramatically. These thermal property enhancements were contributed to the rigid Ph groups of POSS and its inorg. core.

135:243298 Ionic conduction membrane for solid polymeric fuel cell and its manufacture. Arimura, Tomoaki (Nippon Jidosha Kenkyusho, Japan). Jpn. Kokai Tokkyo Koho JP 2001247741 A2 20010911, 11 pp. (Japanese). CODEN: JKXXAF. APPLICATION: JP 2000-63758 20000308.

AB Title ionic conduction membrane has methanol impermeability, heat resistance, high mech. strength, and low prodn. cost and is a composite film of a fiber material and a polymer resin comprising an arom. monomer, an ionically conductive monomer, a high-vol. monomer, and a crosslinking agent. The arom. monomer typically is an arom. vinyl monomer; the ionically conductive monomer is a vinyl monomer having an acid group; the high-vol. monomer is a cage-type monomer formed through bonds such as Si-O, Si-C, and C-C; the crosslinking agent contains arom. ring. The membrane is manufd. by impregnating the fiber material in the monomer soln. followed by polymn.

132:166622 Synthesis of organic/inorganic hybrid materials from polysiloxane precursors using atom transfer radical polymerization. Pyun, Jeffrey; Miller, Peter J.; Kickelbick, Guido; Matyjaszewski, Krzysztof; Schwab, Joseph; Lichtenhan, Joseph (Center for Macromolecular Engineering, Dept. of Chemistry, Carnegie Mellon University, Pittsburgh, PA, 15213, USA). Polymer Preprints

(American Chemical Society, Division of Polymer Chemistry), 40(2), 454-455 (English) 1999. CODEN: ACPPAY. ISSN: 0032-3934.

Publisher: American Chemical Society, Division of Polymer Chemistry.

AB The synthesis of org./inorg. hybrid materials from polyhedral oligomeric silsesquioxanes (POSS) using atom transfer radical polymn. (ATRP) was carried out. From POSS monomers contg. either methacryloyl, or styryl groups, well-defined polymers of various compns. and topologies were prepd. The compn. of these materials was controlled and well-defined homopolymers, random and block copolymers of POSS-contg. monomers were synthesized. The use of macroinitiators of various topologies allowed for the synthesis of ABA-triblock and star-block copolymers, using ATRP.

134:29756 Chemistry of Hydrogen-Octasilsesquioxane: Preparation and Characterization of Octasilsesquioxane-Containing Polymers. Auner, Norbert; Bats, Jan W.; Katsoulis, Dimitris E.; Suto, Michitaka; Tecklenburg, Ronald E.; Zank, Gregg A. (Inst. fur Anorg. Chemie, Johann Wolfgang Goethe University, Frankfurt/Main, D-60439, Germany). Chemistry of Materials, 12(11), 3402-3418 (English) 2000. CODEN: CMATEX. ISSN: 0897-4756. Publisher: American Chemical Society.

AB Over the past five years, there have been a no. of studies that have

concerned themselves with controlling the structure of inorg. networks. Many of these studies have been undertaken due to the need for more advanced or structurally ordered materials in a variety of elec. and optical applications. One of the approaches to create materials that are structurally ordered has been to assemble the higher mol. wt. polymers and materials not from monomeric precursors but from partially assembled oligomeric structural building blocks. In the silicone materials area, the well-known completely condensed cages T_n or Q_n offer convenient higher order building blocks for larger structural assemblies. In most cases materials made by employing these cages as the building blocks have afforded gels or insol. network materials due to the high degree of functionality (typically n) present in these building blocks. In this paper, we report the prepn. of sol. resins that are HT8 cages linked together with divinyl species as links made by hydrosilation chem. and their characterization as it relates to previously reported studies. We have employed a range of linking groups (L) from orgs. (divinyl benzene) and α-Ω functional siloxanes (from a d.p., DP, of 2-12). Interestingly, we have also found it possible to make sol. network materials even when employing two linking groups (L) per cage. We have combined the characterization of the high-mol.-wt. polymers with detailed characterization of small mols. made by these same hydrosilation reactions to provide insights into some relatively simple model Si-resin systems. The characterization of these relatively simple systems helps provide insights into the structure ↔ property relationships of silicone materials in general.

132:195863 Thin coatings derived from cubic octasilicate monomers. Li, Chenghong; Wilkes, Garth L. (Polymer Materials and Interfaces Laboratory Department of Chemistry, Virginia Polytechnic Institute and State University, Blacksburg, VA, 24061, USA). Polymer Preprints (American Chemical Society, Division of Polymer Chemistry), 40(2), 778-779 (English) 1999. CODEN: ACPPAY. ISSN: 0032-3934. Publisher: American Chemical Society, Division of Polymer Chemistry.

AB Thin coatings on aluminum substrates were derived from dimethylsilyl or vinyltrimethylsilyl cubic octasilicates by reacting with other silanes via hydrosilylation or by capping them with triethoxysilyl groups, followed by sol-gel reactions. The coating prepd. by hydrosilylation showed an onset of thermal decompn. at 300° and had a wt. loss of 5% in air at 370° at a temp. ramp of 10°/min. The coating developed by sol-gel reactions with a hydrochloric acid catalyst had a higher extent of condensation than the coating developed with an acetic acid catalyst, however, the former catalyst also caused obvious cage-opening of the silicate cubes. All these coatings were transparent, but lacked abrasion resistance.

L29 ANSWER 20 OF 30 HCA COPYRIGHT 2004 ACS on STN

129:217206 Highly Porous Polyhedral Silsesquioxane Polymers. Synthesis and Characterization. Zhang, Chunxin; Babonneau, Florence; Bonhomme, Christian; Laine, Richard M.; Soles, Christopher L.; Hristov, Hristo A.; Yee, Albert F. (Departments of Chemistry Materials Science and Engineering and the Macromolecular Science and Engineering Center, University of Michigan, Ann Arbor, MI, 48109, USA). Journal of the American Chemical Society, 120(33), 8380-8391 (English) 1998. CODEN: JACSAT. ISSN: 0002-7863. Publisher: American Chemical Society.

AB Polyhedral octahydridosilsesquioxanes, [HSiO_{1.5}]₈ (1) and [(HSiMe₂O)SiO_{1.5}]₈ (3) were hydrosilylatively copolymd. with stoichiometric amts. of the octavinylsilsesquioxanes, [vinylSiO_{1.5}]₈ (2) and [(vinylSiMe₂O)SiO_{1.5}]₈ (4) in toluene using platinum divinyltetramethyldisiloxane, "Pt(dvs)", as catalyst. The degree of condensation of the resultant four copolymers ranges from 43% to 81% depending on intercube chain lengths, as detd. by solid state ¹³C and ²⁹Si MAS NMR analyses, using cross-polarization (CP) techniques. The presence of residual functional groups was confirmed by diffuse reflectance IR Fourier transform spectroscopy (DRIFTS). Polymer porosities were measured using nitrogen sorption, positron annihilation lifetime spectroscopy (PALS), and small angle X-ray scattering (SAXS) methods. The combination of these three techniques allows a relatively complete description of the pore sizes and pore size distributions in these materials. The pores in the cube interiors are .apprx.0.3 nm in diam., while those between the cubes range from 1 to 50 nm in diam. (for polymer 3 + 4). Nitrogen sorption analyses give sp. surface areas (SSAs) of 380 to 530 m²/g with "observable" pore vols. of 0.19-0.25 mL/g.

L29 ANSWER 30 OF 30 HCA COPYRIGHT 2004 ACS on STN

115:72377 Preparation and silicon-29 NMR spectroscopic investigation of polymers with definite silicic acid units. Hoebbel, D.; Pitsch, I.; Heidemann, D. (Zentralinst. Anorg. Chem., Berlin-Adlershof, O-1199, Germany). Zeitschrift fuer Anorganische und Allgemeine Chemie, 592, 207-16 (German) 1991. CODEN: ZAACAB. ISSN: 0044-2313.

AB Three polymers were synthesized by additive reaction of the cage-like double four-ring (D4R) silicic acid derivs. [Me₂HSi]8Si₈O₂₀ and [CH₂:CHMe₂Si]8Si₈O₂₀ resp., with the unsatd. divinyltetramethyldisiloxane or the multiple functional tetramethylcyclotetrasiloxane and polymethylhydrosiloxane, Me₃SiO(SiHMeO)₂SiMe₃, in a molar ratio of functional groups 1:1. By means of ²⁹Si solid state NMR spectroscopy was shown that the in org. solvents insol. polymers are built up by D4R silicic acid units, which are connected by chain-like or cyclic siloxane bridges. With increasing functional groups of the reactants the steric hindrance of the reaction of D4R derivs. grows. The polymers show small surfaces of 1 to 8 m²/g.
